

IT General Controls Audit Findings Report

1. Executive Summary

The IT General Controls (ITGC) assessment identified control gaps related to user access management, change management, and data protection processes. These findings highlight areas where improvements are required to reduce security and operational risks.

2. Audit Findings

Finding 001: Excessive User Access Privileges

Control Area: User Access Management

Risk Rating: High

Observation:

Some users have access permissions beyond their job responsibilities.

Risk:

Excessive access privileges may increase the risk of unauthorized data access or inappropriate system activities.

Recommendation:

Implement regular user access reviews and ensure permissions follow the principle of least privilege.

Finding 002: Incomplete Change Approval Process

Control Area: Change Management

Risk Rating: Medium

Observation:

Some system changes are implemented without documented approval evidence.

Risk:

Unauthorized changes may introduce system errors or security vulnerabilities.

Recommendation:

Require formal approval and documentation before implementing system changes.

Finding 003: Limited Backup Testing

Control Area: Backup Management

Risk Rating: Medium

Observation:

Backup processes exist, but recovery testing is not performed regularly.

Risk:

The organization may not be able to restore critical data effectively after an incident.

Recommendation:

Perform scheduled backup restoration tests and document results.
